

Write a C++ program to divide two complex numbers using a class.

Code:-

```
#include <iostream>
using namespace std;

class Complex
{
public:
    double real, imag;
    Complex(double r = 0, double i = 0) : real(r), imag(i) {}
    Complex divide(Complex other)
    {
        double denom = other.real * other.real + other.imag * other.imag;
        double r = (real * other.real + imag * other.imag) / denom;
        double i = (imag * other.real - real * other.imag) / denom;
        return Complex(r, i);
    }
};

int main()
{
    double a, b, c, d;
    cout << "Enter first complex number (real imag): ";
    cin >> a >> b;
    cout << "Enter second complex number (real imag): ";
    cin >> c >> d;
    Complex c1(a, b), c2(c, d);
    Complex result = c1.divide(c2);
    cout << "Result: " << result.real << " + " << result.imag << "i" << endl;
    return 0;
}
```
