

Sort the numbers in an array using separate functions for read, display, sort, swap :-

```
#include <iostream>
using namespace std;
void swap(int &a, int &b)
{
    int temp = a;
    a = b;
    b = temp;
}
void acceptArray(int arr[], int n)
{
    cout << "Enter " << n << " elements: ";
    for (int i = 0; i < n; i++)
    {
        cin >> arr[i];
    }
}
void displayArray(int arr[], int n)
{
    cout << "Array elements are: ";
    for (int i = 0; i < n; i++)
    {
        cout << arr[i] << " ";
    }
}
void sortArray(int arr[], int n)
{
    for (int i = 0; i < n - 1; i++)
    {
        for (int j = i + 1; j < n; j++)
        {
            if (arr[i] > arr[j])
            {
                swap(arr[i], arr[j]);
            }
        }
    }
}
int main()
{
    int n;
    cout << "Enter the size of the array: ";
```

```
cin >> n;  
int arr[n];  
acceptArray(arr, n);  
sortArray(arr, n);  
cout << "Sorted array in ascending order: ";  
displayArray(arr, n);  
return 0;  
}
```
