

Write a C++ program to overload the area() function to calculate the area of a circle and a triangle.

Code:-

```
#include <iostream>
using namespace std;
double area(double radius)
{
    return 3.14159 * radius * radius;
}
double area(double base, double height)
{
    return 0.5 * base * height;
}

int main()
{
    double radius, base, height;
    cout << "Enter radius of circle: ";
    cin >> radius;
    cout << "Area of circle: " << area(radius) << endl;
    cout << "\nEnter base and height of triangle: ";
    cin >> base >> height;
    cout << "Area of triangle: " << area(base, height) << endl;
    return 0;
}
```
